

Business Requirements Document

Modern Workplace Deployment

Client: Contoso Design Ltd

Prepared by: Md Ariful Hoque

Role: IT Infrastructure Consultant

Version: 1.0

1. Executive Summary

Contoso Design Ltd is an interior design company with 25 employees operating from a single office, with eight employees working remotely. The company currently uses Microsoft 365 for email and collaboration but lacks a centralised approach to identity management, endpoint administration and security.

As the business has grown, user accounts and devices have been managed manually. Passwords are frequently shared, new laptops are configured individually without a standard process, and former employees may still retain access to company resources. These practices increase operational risk, reduce productivity and make it difficult to maintain a secure IT environment.

This project proposes the implementation of a modern Microsoft cloud workplace using Microsoft Entra ID, Microsoft Intune and Microsoft Azure. The solution will establish secure identity management, standardise endpoint configuration and create a documented administrative environment that can be maintained as the organisation continues to grow.

The project has been designed to deliver practical improvements while remaining appropriate for a small business with limited IT resources.

2. Company Overview

Contoso Design Ltd provides interior design services for residential and commercial clients. The company employs designers, project managers, sales staff, finance personnel and a small administration team. Staff regularly collaborate using Microsoft 365 and frequently access company resources from both the office and remote locations.

The company currently has no dedicated IT department. Technology has been managed on an ad hoc basis, resulting in inconsistent security settings, limited documentation and no formal user management process.

The business requires a secure, reliable and easy-to-manage Microsoft cloud environment that supports both office-based and remote employees.

3. Current Environment Assessment

A review of the existing environment identified several operational and security concerns that require improvement.

User accounts are managed manually, making it difficult to control access permissions throughout the employee lifecycle. Several staff members share passwords for convenience, increasing the likelihood of unauthorised access.

New laptops are prepared individually without a documented configuration standard. This results in inconsistent security settings, different software versions and increased deployment time whenever new employees join the company.

Remote employees connect using personal working practices, with no central method of verifying that devices meet organisational security requirements.

The organisation also lacks formal technical documentation, making future support and troubleshooting unnecessarily difficult.

Although these issues have not yet caused major business disruption, they increase operational risk and reduce the organisation's ability to scale efficiently.

4. Business Problems

The following key issues have been identified during the assessment.

- Shared passwords reduce account security and accountability.
- User accounts are not centrally managed.
- Access permissions are assigned inconsistently.
- Former employees may continue to retain access after leaving the business.
- Laptop configuration depends on manual setup by individual staff members.

- Device security settings vary between computers.
- No standard onboarding or offboarding process exists.
- There is no documented administrative guide for future IT support.

These weaknesses increase support costs, introduce avoidable security risks and reduce confidence in the company's technology platform.

5. Project Objectives

The primary objective of this project is to modernise the company's Microsoft environment using cloud-based identity and endpoint management.

The project will:

- Implement centralised user identity management using Microsoft Entra ID.
- Organise users through departmental security groups.
- Introduce structured role-based administration.
- Deploy Microsoft Intune to support central device management.
- Establish a basic endpoint security baseline.
- Improve the onboarding and offboarding process.
- Produce clear technical documentation for future administrators.

The proposed solution has been designed to improve both operational efficiency and information security without introducing unnecessary complexity.

6. Project Scope

In Scope

The following activities are included within this engagement:

- Configure Microsoft Entra ID.
- Create departmental user accounts.
- Create security groups.
- Configure administrative roles.

- Deploy a basic Azure environment.
- Create a Resource Group.
- Create a Virtual Network.
- Deploy one Windows Virtual Machine for administration purposes.
- Create one Storage Account.
- Configure one Network Security Group.
- Create Microsoft Intune compliance policies.
- Configure standard device settings.
- Produce technical documentation.
- Perform solution validation.

Out of Scope

The following activities are specifically excluded from this project:

- Active Directory migration.
- Exchange Server migration.
- Microsoft Sentinel deployment.
- Azure Firewall implementation.
- Azure Kubernetes Service.
- Advanced automation or scripting.
- Hybrid identity synchronisation.
- Third-party security software.
- Backup and disaster recovery implementation.

These items may be considered during future phases of the organisation's digital transformation.

7. Proposed Solution

The recommended solution introduces a secure Microsoft cloud platform that provides consistent identity management and endpoint administration.

Microsoft Entra ID will become the central identity provider for all users. Security groups will simplify permission management and reduce administrative effort.

Microsoft Intune will provide centralised management of Windows devices, allowing security policies and configuration settings to be applied consistently across all managed endpoints.

Microsoft Azure will host a small administrative environment containing core infrastructure resources required to support the project.

The solution has been designed using Microsoft best practices while remaining appropriate for the size and operational requirements of Contoso Design Ltd.

8. Success Criteria

The project will be considered successful when the following outcomes have been achieved:

- All users authenticate using Microsoft Entra ID.
- Departmental security groups are configured correctly.
- Administrative permissions follow the principle of least privilege.
- Microsoft Intune compliance policies are successfully deployed.
- Standard device configuration policies are created.
- Azure resources are operational.
- Technical documentation is completed and handed over.
- The solution can be maintained by future administrators.

These outcomes provide measurable improvements in security, administration and operational consistency.

9. Risks and Assumptions

Risks

Potential project risks include incorrect permission assignments, inconsistent naming standards and policy configuration errors during implementation.

These risks will be reduced through staged deployment, configuration reviews and structured documentation.

Assumptions

This project assumes that:

- The client already has access to Microsoft 365.
 - Internet connectivity is available.
 - Windows 11 devices are used throughout the organisation.
 - Appropriate Microsoft licences are available for the required features.
 - The client has approved the project scope before implementation begins.
-

10. Conclusion

Contoso Design Ltd requires a secure, standardised and manageable Microsoft cloud environment to support its growing workforce.

The proposed Modern Workplace Deployment addresses the organisation's immediate operational and security challenges through centralised identity management, endpoint administration and structured documentation. The solution has been intentionally designed to be practical, scalable and straightforward to maintain, allowing the business to improve security while reducing administrative effort.

On successful completion, the organisation will benefit from a modern workplace platform that supports secure collaboration, efficient user management and consistent device administration, providing a solid foundation for future business growth.
